

# Structure of Java

# Structure of Java

- Class
  - Method
    - Statement
- Documentation/Comments
- Spacing

```
1  /**
2   * This is an example class that illustrates printing a message to the screen
3   *
4   * @author Gina Bai
5   */
6  public class HelloWorld {
7      /**
8       * Starts the program.
9       *
10      * @param args command line arguments
11      */
12     public static void main(String[] args) {
13         System.out.println("Hello World!");
14     }
15 }
```

# Documentation/Comments

- Comment
  - A note written in source code by the programmer to describe or clarify the code
- Comments are **not executed** when your program runs.
- See Programming Style Guide  
(Brightspace > Content > Course Documents)

```
1  /**
2   * This is an example class that illustrates printing a message to the screen
3   *
4   * @author Gina Bai
5   */
6  public class HelloWorld {
7
8      /**
9       * Starts the program.
10      *
11      * @param args command line arguments
12      */
13     public static void main(String[] args) {
14         System.out.println("Hello World!");
15     }
```

# Class – A program

- Class Header
  - Naming convention: capitalize the first letter of each word, no space in between (e.g. HelloWorld)
- The **filename** (HelloWorld.java) must **match exactly** with **class name**, including capitalization
  - Java is "**case-sensitive**"
- Matching braces {} (lines 6 & 15)

```
1  /**
2   * This is an example class that illustrates printing a message to the screen
3   *
4   * @author Gina Bai
5   */
6  public class HelloWorld {
7      /**
8       * Starts the program.
9       *
10      * @param args command line arguments
11      */
12     public static void main(String[] args) {
13         System.out.println("Hello World!");
14     }
15 }
```

# Method – A named group of statements

- Method Header
  - Naming convention: begin with a lowercase letter, capitalize the first letter of the attached words
- **Every** executable Java program consists of a class, that contains a method named **main** that contains the statements to be executed.
- Matching braces {} (lines 12 & 14)

```
1  /**
2   * This is an example class that illustrates printing a message to the screen
3   *
4   * @author Gina Bai
5   */
6  public class HelloWorld {
7      /**
8       * Starts the program.
9       *
10      * @param args command line arguments
11      */
12     public static void main(String[] args) {
13         System.out.println("Hello World!");
14     }
15 }
```

# Statement – An instruction to be executed

- **Ends with semi-colon ( ; )**

```
1  /**
2   * This is an example class that illustrates printing a message to the screen
3   *
4   * @author Gina Bai
5   */
6  public class HelloWorld {
7      /**
8       * Starts the program.
9       *
10      * @param args command line arguments
11      */
12     public static void main(String[] args) {
13         System.out.println("Hello World!");
14     }
15 }
```

# Spacing

- The best way to make your code readable is to **indent** nested code
- Indent every time you **go inside braces**
- You must indent using **four spaces** or **one tab**
- See Programming Style Guide  
(Brightspace > Content > Course Documents)

```
1  /**
2   * This is an example class that illustrates printing a message to the screen
3   *
4   * @author Gina Bai
5   */
6  public class HelloWorld {
7      /**
8       * Starts the program.
9       *
10      * @param args command line arguments
11      */
12      public static void main(String[] args) {
13          System.out.println("Hello World!");
14      }
15  }
```

# Identifier

- Identifier is a **name** given to an entity in a program, such as class name
- Identifiers **start with a letter** and are followed by a number of letters or digits. Letters include:
  - Alphabetic characters, upper and lower case (A-Z, a-z)
  - Underscore (\_)
  - Dollar sign (\$)
- Identifiers should be descriptive/meaningful

# Java Keywords

An identifier that you cannot use because it already has a **reserved** meaning in Java.

<code>abstract</code>	<code>default</code>	<code>if</code>	<code>private</code>	<code>this</code>
<code>boolean</code>	<code>do</code>	<code>implements</code>	<code>protected</code>	<code>throw</code>
